Consider **claim 83**, Alexander clearly teaches a system for uninterrupted and passive continuous monitoring and measuring viewer behavior of a plurality of television viewers and pattern data among viewer events and channel change events in a plurality of viewing premises to provide information for direct correlation with concurrent detailed data of programming and broadcasting in order to analyze and ascertain the responses of the plurality of viewers to program and advertising content for the purpose of assessing the effectiveness of said programming and advertising content, wherein the results of said analysis can be made available to advertisers, said system comprising:

a plurality of signal receiving devices located in a plurality of viewing premises **(The invention is a television system, which includes a plurality of receiving devices located in a plurality of viewing premises.)**, wherein each said signal receiving device comprises:

a monitor device for uninterrupted and passive continuous monitoring of television viewer behavior, **(Information about the viewer is captured on a continuous basis, col. 29 lines 22-30.)** the monitor device configured for monitoring event data generated upon occurrence of television viewer events and channel change events to ascertain television viewer behavior and pattern data among television viewer events and channel change events on the continuous basis; **(Channel changes and viewer events are monitored and recorded on a continuous basis, col. 28 lines 30-52.)**

an event timing device for recording a time record of event occurrence and for generating time-stamped data representative of time of occurrence corresponding to the event data; **(col. 28 line 35)**
